

1 ABSTRACT OF THE DISCLOSURE

2 An examining device for cloth includes a first container having two opposite
3 open ends, a second container having a closed end and an open end, a combining device
4 to combine the first container and the second container and an air supply device in
5 connection with the second container to supply air into the second container. After a
6 cloth is sandwiched between the combining means and the first container and after the
7 first container is filled with water and the second container is supplied with air,
8 observation made to see if water seeps through the cloth and air passes through the cloth
9 is able to test capabilities of the cloth.
